

Determining K-thermal conductivity

The K-thermal conductivity chart below provides conductivity values for a variety of steel and non-steel materials under various heating conditions. These factors determine how well heat passes through a material and can be used to improve the tooling and processing of an injection molded part.

For example, if a molder is trying to extract more heat out of one particular area in a molded part, using a different type of material for that specific portion of the mold may be a better alternative than changing the processing temperature for that entire half of the mold.

The chart provides a guideline for increasing or decreasing the heat extraction rates as the design and/or tooling requires.
